Given an array of integers `nums` containing  $n + 1$  integers where each integer is in the range  $[1, n]$  inclusive. There is only **one repeated number** in `nums`, return *this repeated number*. Solve the problem using [set](#).

## Example 1:

Input: `nums = [1,3,4,2,2]`

Output: 2

## Example 2:

Input: `nums = [3,1,3,4,2]`

Output: 3

## For example:

Input	Result
1 3 4 4 2	4

Answer: (penalty regime: 0 %)

```

1 a=[]
2 b = input()
3 a.append(b)
4 b = str(a)
5 b.split()
6 c=[]
7 d = []
8 for i in b:
9     if i not in c:
10         if chr(48)<i<chr(57):
11             c.append(i)
12         elif i in c:
13             if chr(48)<i<chr(57):
14                 d.append(i)

There is a malfunctioning keyboard where some letter keys do not work. All other keys on the keyboard work properly.

Given a string text of words separated by a single space (no leading or trailing spaces) and a string brokenLetters of all distinct letter keys that are broken, return the number of words in text you can fully type using this keyboard.

Example 1:

Input: text = "hello world", brokenLetters = "ad"

Output:

1

Explanation: We cannot type "world" because the 'd' key is broken.

**For example:**

Input	Result
hello world ad	1

Write a program to eliminate the common elements in the given 2 arrays and print only the non-repeating elements and the total number of such non-repeating elements.

Input Format:

The first line contains space-separated values, denoting the size of the two arrays in integer format respectively.

The next two lines contain the space-separated integer arrays to be compared.

[Sample](#) Input:

```
5 4
1 2 8 6 5
2 6 8 10
```

[Sample](#) Output:

```

**For example:**

Input	Result
5 4	1 5 10
1 2 8 6 5	3
2 6 8 10	

**Answer:** (penalty regime: 0 %)
